At the end of May, the **MSCI COLCAP** stood at 1,609, 41 units below analysts' forecast (1,650). The index is expected to reach a level of 1,650 by the end of June.

In June, the **One-Year Confidence Index** stood at 85.7%, down 10.3 percentage points from the previous month (96.0%) and 7.4 percentage points from the same month in 2024 (93.1%). This indicates that the proportion of analysts who foresee a COLCAP appreciation in the next 12 months decreased compared to the previous month and compared to a year ago.

The **Buy-on-Dips Confidence Index** stood at 60.0% in June, increasing by 6.7 percentage points versus the previous month (53.3%), but decreasing by 5.0 percentage points versus the same month in 2024 (65.0%). The above implies that analysts consider more likely an increase in the MSCI COLCAP the day after a potential drop in the index compared to May 2025, but below June 2024 levels.

In June, the **Crash Confidence Index** stood at 60.0%, down 15 percentage points from the previous month (75.0%), but up 19.1 percentage points from the same month in 2024 (40.9%). This indicates that analysts consider the local market more vulnerable to downturns in international markets compared to the previous month, but less so than a year ago.

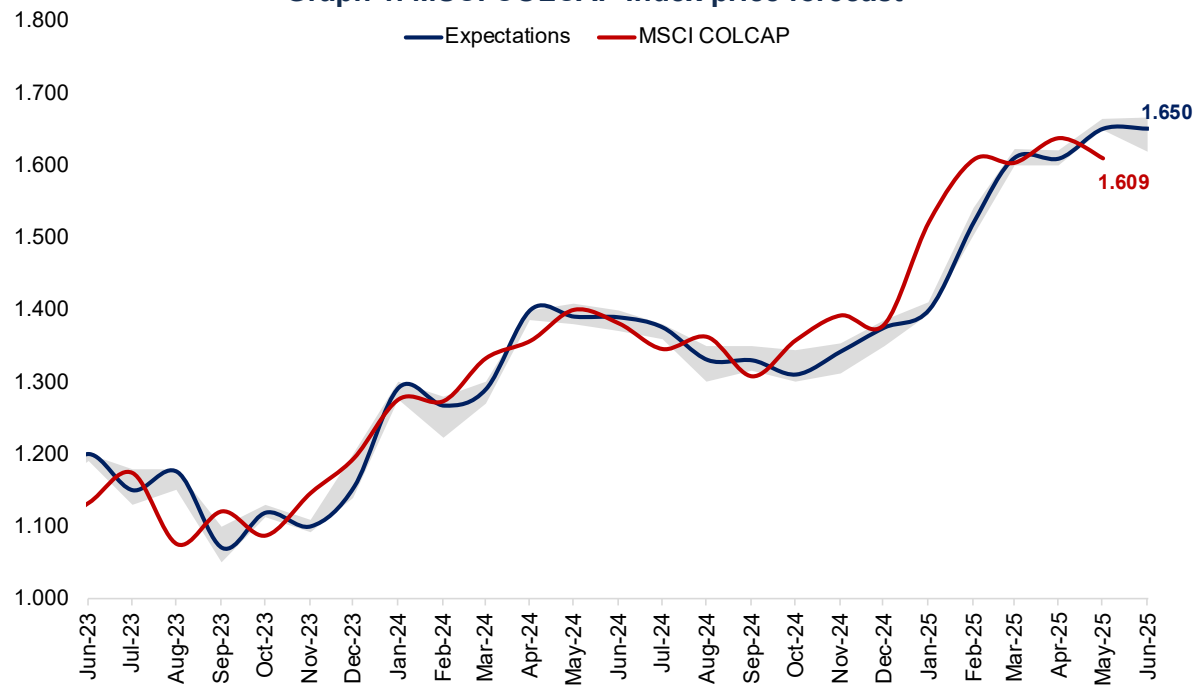

Finally, the **Valuation Confidence Index** stood at 84.4% in June, down 0.9 percentage points from the previous month's level (85.3%) and down 8.8 percentage points from the same month in 2024 (93.2%). This implies that a smaller proportion of analysts believe that equity values underestimate the value of their fundamentals versus May 2025 and June 2024.

MSCI COLCAP Index

The MSCI COLCAP index, which reflects the variations in the prices of the most liquid stocks on the Colombian Stock Exchange (bvc), represents one of the most important leading indicators for monitoring the country's capital market. The average so far for June 2025 (up to June 16) is at 1,649, which represents a devaluation of 0.1% with respect to the average for May 2025 (1,651), but an appreciation of 19.1% with respect to the average for June 2024 (1,385).

At the end of May, the MSCI COLCAP stood at 1,609, which corresponds to 41 units below the analysts' forecast (1,650). By the end of June, the index is expected to increase to 1,650 as a median response, in a range between 1,619 and 1,667 (Graph 1).

The four confidence indices for the Colombian stock market are presented down below. These indices are calculated based on the Shiller (2000)[1] methodology and using the analysts' expectations collected in the Financial Opinion Survey.

One-Year Confidence Index[2]

The One-Year Confidence Index measures the proportion of analysts who expect an increase in the MSCI COLCAP over the next year. In this edition, the index stood at 85.7%, indicating that this percentage of respondents expects an increase in the index in May 2026 with respect to the level prior to sending the survey (1,636) (Graph 2). The index experienced a drop of 10.3 percentage points compared to the previous month (96.0%) and of 7.4 percentage points compared to the same month of the previous year (93.1%), which reflects a deterioration in stock market confidence compared to the previous month and compared to the level of June 2024.

[2] The One-Year Confidence Index is calculated as the number of respondents that establish a price for the MSCI COLCAP index in 12-months higher than the current level of the index, divided by the total responses excluding invalid answers.

Buy-on-Dips Confidence Index[3]

The Buy-on-Dips Confidence Index measures the proportion of analysts who believe that the MSCI COLCAP has the ability to recover the day after a hypothetical 3% drop. In June 2025, the index stood at 60.0%, increasing by 6.7 percentage points compared to May (53.3%) (Graph 3). However, analysts consider an immediate recovery of COLCAP less likely compared to the same month of 2024 (65.0%), representing a drop of 5.0 percentage points.

[3] The Buy-on-Dips Confidence Index is calculated as the number of respondents who expect an increase in the MSCI COLCAP index the next day after a 3% drop, divided by the total answers excluding the "no opinion" option.

Crash Confidence Index[4]

The Crash Confidence Index shows the proportion of analysts who believe that the Colombian stock market has a low probability of a depreciation in the MSCI COLCAP over the next six months in the event of a sharp decline in international markets. In June 2025, the index decreased 15 percentage points with respect to the previous month's result (75.0%), standing at 60.0%, indicating that the perception of the probability of an eventual fall of the local stock market in the face of the deterioration of international markets increased compared to May 2025 (Graph 4).

Furthermore, the index was 19.1 percentage points above the figure recorded in the same month of the previous year (40.9%), reflecting an improvement in confidence in the immunity of the stock market to external shocks compared to June 2024.

Graph 4. Crash Confidence Index

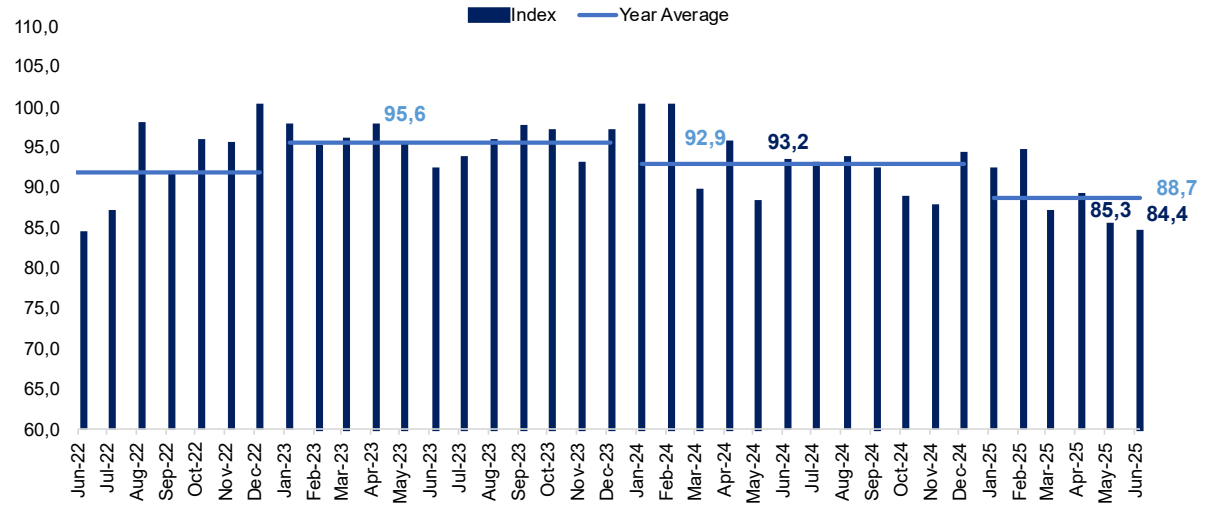

Source: Financial Opinion Survey, Fedesarrollo – bvc.

[4] The Crash Confidence Index is calculated as the number of responses who attach a probability between 0% and 25% to a stock market crash in the next six months including the case that a crash occurred in the international markets and spreads to Colombia, divided by the total responses excluding the "does not apply" option.

Valuation Confidence Index[5]

The Valuation Confidence Index measures the proportion of analysts who consider the prices of MSCI COLCAP stocks to be very low or fair relative to their fundamental value. In June 2025, the index stood at 84.4%, 0.9 percentage points below the figure observed in May (85.3%) and 8.8 percentage points below the level of June 2024 (93.2%). This indicates that, compared to the previous month and compared to a year ago, a smaller proportion of analysts believe that the value of stocks underestimates the value of their fundamentals (Figure 5).

[5] The Valuation Confidence Index is calculated as:
$Valuation\ Confidence\ Index = \left(1 * (\%\ too\ low)\right) + \left(0.5 * (\%\ about\ right)\right)$, where % too low and % about right, correspond respectively to the number of analysts who chose that the values of the local stocks are too low and about right in regard of the fundamental value excluding the option “do not know”.
